

Tutorial on Proper installation of All our Software

How to properly install all our software applications

1. Installation instructions for Windows 95 - XP:

If you are running Windows 95 up-to Windows XP on your computer, you will not have any problems installing and running all our desktop and portable software. Microsoft created these operating systems perfectly and they run perfectly too with our applications.

2. Installation instructions for Windows Vista / 7 / 8:

If on the other hand you have Windows Vista / 7 or 8 installed, you may experience some difficulty depending which software you are installing. Most of our installshield software will not have any problem running on your system, as long as you run them as an administrator. Simply right-click on the setup executable and select the "Run as Administrator" option in the popup shortcut menu. That's all you need to do.

If you are running one of the portable database or spreadsheet software{QT Calc} applications, you will have to run them with administrator rights. Again, you will only need to right-click on the executable or icon and select the "Run as Administrator" option. You will only need to do this once.

Desktop Database Software:

As for running desktop database software on Windows Vista / 7 and 8, you will need to make the administrator rights permanent.

You will need to do the following:

1. Find the application executable or shortcut icon and right-click on it and select "Properties..." - {at the bottom of the popup menu}
2. Go to the Compatibility tab and change the following settings:
3. At the bottom, select the "Run this program as an administrator". This will grant you access to run the applications successfully.
4. Press on "Apply" and then press "OK". The database program should run now.

The above instructions are only necessary for MonoBase, Invoice Master, and the main start-up menu for the Blade Runner office suite.

64 Bit Windows Systems:

If you have a 64 bit Windows system, you will need to adjust the database path for Invoice Master, as the program file's folder has a different description - C:\Program Files (x86)\ instead of the usual path C:\Program Files\ for 32 bit systems.

To correct this problem, simply do the following:

1. Go to your control panel and open the "BDE Administrator" - {classic view}
2. Select the "Database" header to list all the databases
3. If your application is listed, make sure it's path is correctly shown on the right-hand side
4. To change the path to the correct one, simply double-click on the path shown and find the database folder where you installed it.

The correct path for Windows 64 bit systems must be the following: C:\Program File (x86)\AppName\Data

That is it, if you follow the above instructions, everything will run smooth as can be.

Please also remember to read the "Read Me" file after you have installed these software!
